Rent Watch · My Units

Sample report. Are you charging too little or too much for each apartment, how does it compare with the market and with PriceLabs, and what should you change?

Made-up sample data. Every unit, price and number in this report is invented to show the layout. Market numbers marked “our market price” will come from the scoring engine, and “PriceLabs” numbers from your PriceLabs account once connected.

▼ Underpriced units	Room to raise rent	▲ Vacancy risk	● On target	Sources disagree
5	**+$900**	**3**	**4**	**2**
of 12 apartments	per month, +$10,800 a year	units priced above market	within 5% of market	check before changing

Monthly rent roll today: **$16,220**. At our market price it would be **$16,390**.

Colour key

■ ▼ **Far below market**	More than 15% under
■ ▼ **Below market**	5% to 15% under
■ ● **On target**	Within 5%
■ ▲ **Above market**	5% to 15% over
■ ▲ **Far above market**	More than 15% over

Blue means you charge less than the market. Grey means on target. Red means you charge more. Every colour also has a word and an arrow, so the report reads correctly in black and white.

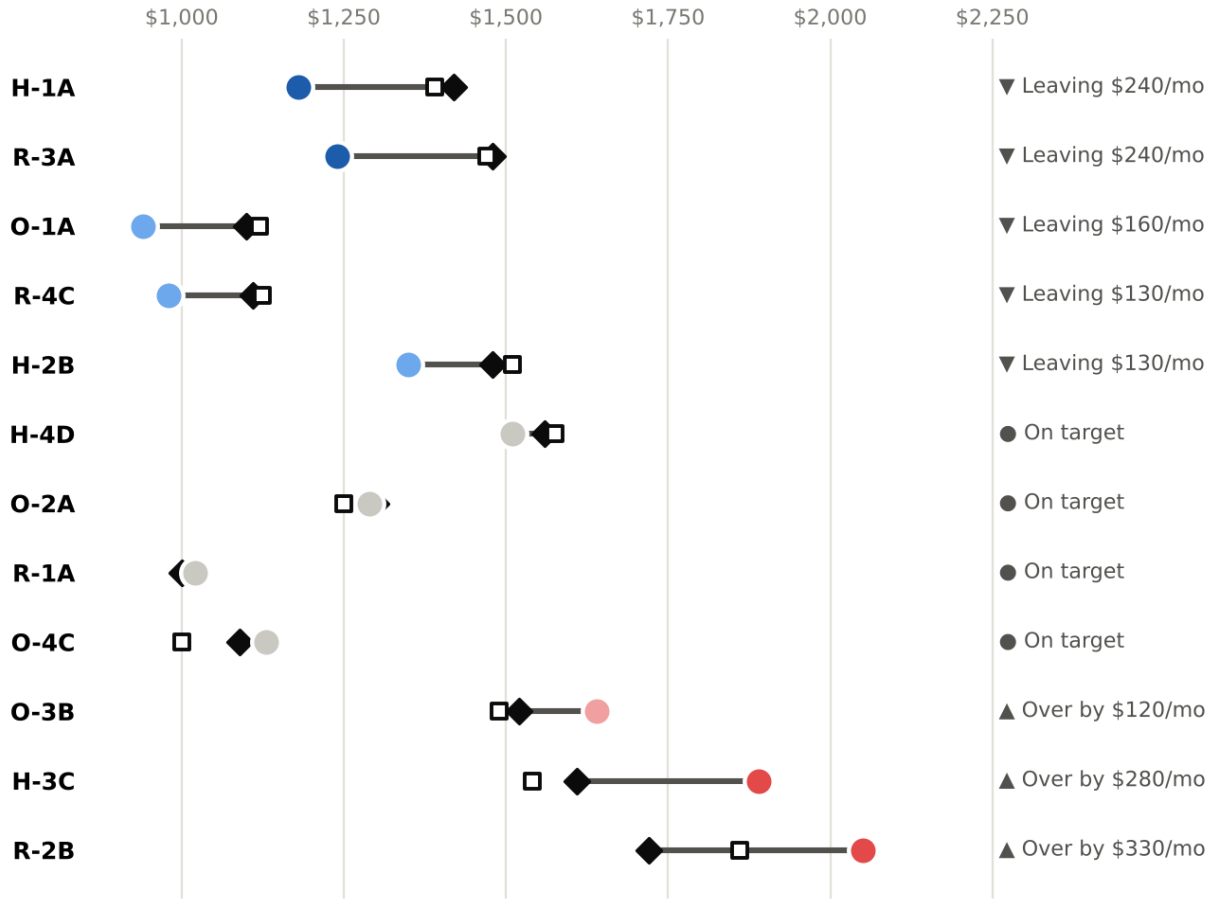

Three numbers are compared for every unit

Rent now What you charge today.	**Our market price** What similar apartments nearby ask, from the scoring engine.	**PriceLabs recommendation** The price PriceLabs suggests for the same unit.

When our market price and PriceLabs are within 7% of each other, the dashboard suggests a new rent from their average. When they are further apart, it shows “Review: sources disagree” and sends nothing until a person has looked.

Your rent against the market

Each row is one apartment. The coloured dot is what you charge now. The black diamond is our market price. The hollow square is the PriceLabs recommendation. The line between dot and diamond is the monthly gap.

Sorted from most underpriced (top) to most overpriced (bottom). Dot colour = band, as in the key on page 1.

Unit by unit: comparison and suggested move

Suggested price = 97% of the average of our market price and PriceLabs for underpriced units, or 103% for overpriced ones, only when the two sources agree within 7%.

Unit	Rent now	Our market	PriceLabs	Where you are	Lease ends	Suggested move	Change / month
H-1A Harbor Court	$1,180	$1,420	$1,390	▼ Far below market 17% under	Mar 2027	▲ Raise to $1,360	**+$180**
R-3A Riverside Flats	$1,240	$1,480	$1,470	▼ Far below market 16% under	Dec 2026	▲ Raise to $1,430	**+$190**

R-2B Riverside Flats	$2,050	$1,720	$1,860 +8% vs ours	▲ Far above market 19% over	Sep 2027	⚠ Review: sources disagree	—

7 moves ready (shaded rows need a review first)

Effect on rent roll: **+$350 / month · +$4,200 / year**

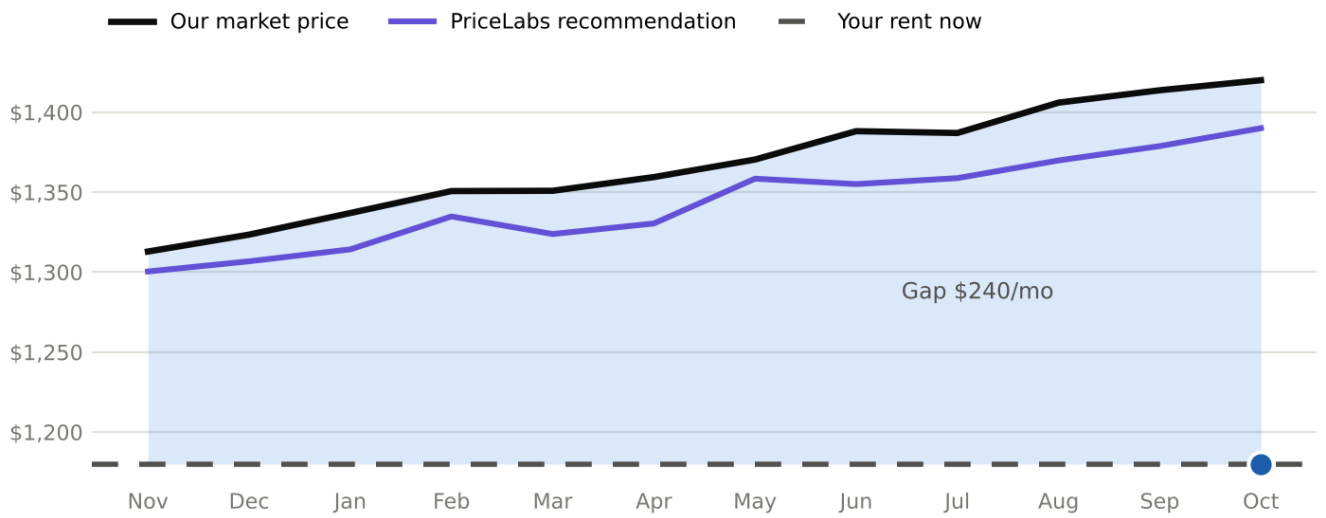

Rent increases may be limited by local law or by the lease. Check your rules before changing a rent. Increases happen at lease renewal unless the lease says otherwise.

When you can act: lease renewals

Unit detail: H-1A · Harbor Court

2 bed · 78 m² · lease ends Mar 2027. Rent now $1,180. Our market price $1,420. PriceLabs recommends $1,390.

The shaded area is the money you are not collecting each month. Both the market and PriceLabs have risen over the year while your rent stayed flat.

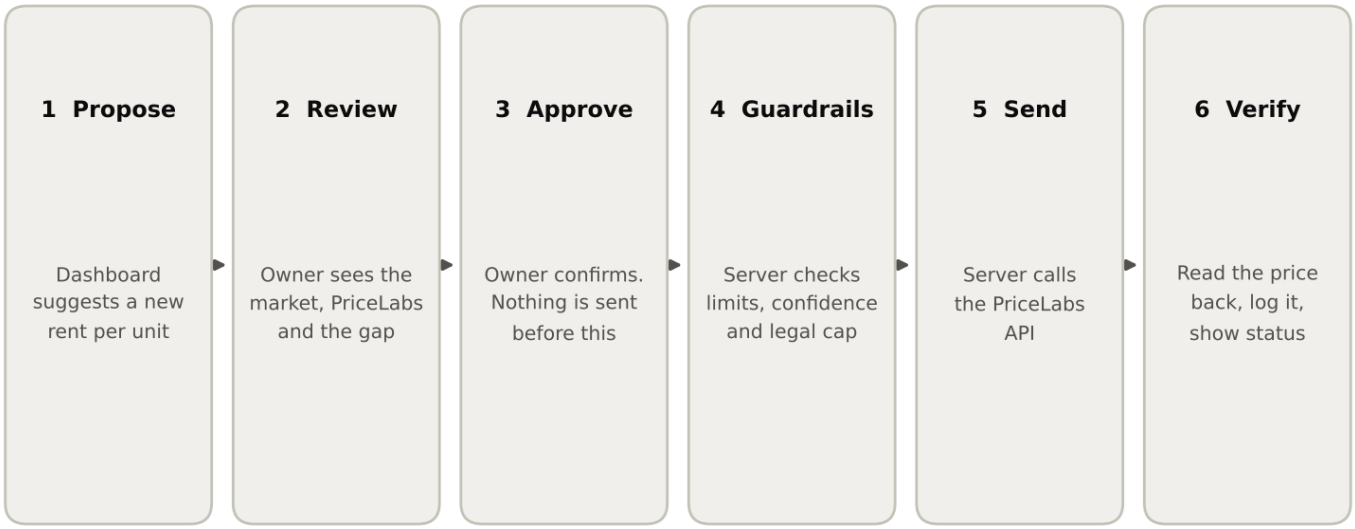

Review and send the new price to PriceLabs (screen sample)

Unit	H-1A · Harbor Court
Current price in PriceLabs	$1,180 per month (read from PriceLabs 06:00 today)
Proposed new price	**$1,360** per month (+$180, +15%)
Effective from	Lease renewal, Mar 2027 (change to “immediately” for vacant units)
Why	17% below our market price and 15% below the PriceLabs recommendation. Both sources agree within 7%.
Guardrail checks	✔ Within 10% single-step cap ✔ Inside floor and ceiling (80%–120% of market) ✔ Confidence is High (22 comparables) ✔ Sources agree ✔ Not over today’s limit of 20 changes
Status	Proposed → **Awaiting your approval** → Sent → Confirmed

Approve and send to PriceLabs | **Cancel**

How the dashboard tells PriceLabs to change a price

The dashboard never changes a price silently. Every change goes through six steps, and nothing leaves our server until a person approves it.

Safety rules built into the push

- Approval required for every change. No automatic sending in version 1.
- Single-step cap: no increase above the local legal limit, or 10% if none applies. Larger gaps are done in two steps.
- Floor and ceiling: new price stays between 80% and 120% of our market price.
- No change when confidence is Low, or when our market price and PriceLabs differ by more than 7%, until a person reviews it.
- Daily limit on the number of changes, and a short delay so a mistaken batch can be cancelled.
- Read-back check: after sending, the server reads the price from PriceLabs again and compares. A mismatch shows as Failed with the reason.
- Full history: who approved, old price, new price, time, and PriceLabs response. One-click undo restores the previous price.
- Your PriceLabs key lives only in server settings, never in the browser, the code, or chat. Each owner can only change their own units.

What needs confirming with PriceLabs

PriceLabs is best known for short-term rental pricing and offers an API with an account key. We have not yet checked which write operations your plan allows (for example changing a listing’s base price, minimum and maximum price, or date-specific overrides), whether long-term rentals are supported, or the rate limits. Abbas confirms this first, in the PriceLabs documentation or with their support. If writing is not allowed, the fallback is an export file of approved prices that you upload to PriceLabs by hand, with the same approval and history.

Implementation prompt for Abbas and Karim

Copy everything on this page and the next into a message. Fill in the four blanks in square brackets first. Karim builds the dashboard, Abbas builds the data, scoring and PriceLabs connection. Swap the names if needed.

PROJECT
Rent Watch "My Units". A dashboard for a landlord or property manager. For each of their own apartments it shows the rent they charge today, compares it with (1) the market and (2) PriceLabs, says whether the rent is below, on or above the market, suggests a new rent, and lets the owner approve that change and send it to PriceLabs from the dashboard. Approved mockup: [link to My Units mockup].

WHO DOES WHAT
Karim: dashboard (front end). Abbas: data, scoring and PriceLabs connection (back end). Agree the data shapes in section 1 on day one so you can work in parallel.

BLANKS TO FILL BEFORE SENDING
Market and currency: [city, currency]. Rental type: [long-term or short-term]. Local rent increase limit: [limit, or 10% if none]. Alerts by: [email or WhatsApp].

1. DATA SHAPES
Unit: { id, building, name, beds, size_m2, floor, furnished, building_age, lat, lng, current_rent, currency, lease_start, lease_end, status: occupied | vacant, pricelabs_listing_id }
MarketScore: { fair_price, fair_low, fair_high, deviation_pct, band, confidence, comps_count, reasons: [text], trend_12m: [12 monthly fair prices] }
PriceLabsSnapshot: { unit_id, taken_at, current_price, recommended_price, min_price, max_price, overrides: [{date, price}] }
PriceChange: { id, unit_id, old_price, new_price, effective_from, reason, source_prices: {market, pricelabs}, status: proposed | approved | sent | confirmed | failed | cancelled | undone, proposed_by, approved_by, approved_at, pricelabs_response, readback_price, created_at }
deviation_pct = (current_rent - fair_price) / fair_price. Bands: far below <= -15%, below -15% to -5%, on target within 5%, above 5% to 15%, far above > 15%.

2. ABBAS: DATA, SCORING, PRICELABS
A. Confirm PriceLabs first. Read the PriceLabs API documentation (or ask their support) and write down in one page: which read endpoints give us listing, current price, recommended price, min and max; which write operations our plan allows (base price, min and max, date-specific overrides); whether [long-term or short-term] rentals are supported; rate limits. If writing is not allowed, build the fallback: an export file of approved prices for manual upload, with the same approval and history.
B. Credentials. The PriceLabs key is read only from the environment variable PRICELABS_API_KEY (or the secret manager). Never in code, the browser, logs or chat. Use the least access the key allows.
C. Ingest. Nightly pull of PriceLabs snapshots for every unit. Market data from sources we are allowed to use (PriceLabs market data if available, official APIs, licensed data, partner feeds, CSV upload). Do NOT scrape any site whose terms forbid it. Respect robots.txt and rate limits. Keep a daily snapshot so trends can be drawn.
D. Clean. Remove duplicates (same address, size and price within 7 days), drop listings not seen for 60 days, convert currency, rent period and size units, trim outliers.
E. Fair price per unit. Median of comparable listings (same area, size within 20%, same bedrooms, last 90 days, at least 8 comps), then a regression on log(rent) with size, bedrooms, floor, furnished, building age and distance to centre or transit. Fall back to comps when data is thin. Measure error on held-out listings (MAPE), show it in the dashboard, target under 10%. Confidence: High with 20 or more comps, Medium 12 to 19, Low below 12.
F. Compare with PriceLabs. For each unit return rent now, our market price, PriceLabs recommended price and the percent difference between the last two. If they differ by more than 7%, set flag SOURCES_DISAGREE and do not produce an automatic suggestion.
G. Suggested price. If on target: keep. If below market: 97% of the average of our market price and the PriceLabs recommendation, applied at lease renewal. If above market: 103% of that average. Cap any single step at the local limit or 10%, and say so in the reason text.
H. Price change workflow (server side). POST /price-changes creates a proposal. POST /price-changes/:id/approve records the approver. A background worker then (1) re-runs all guardrails, (2) calls PriceLabs to set the new price, (3) reads the price back, (4) sets status to confirmed or failed with the reason. Use idempotency keys so a retry never sends twice. POST

/price-changes/:id/undo restores the old price. GET /price-changes lists history. Nothing is ever sent without an approved record.
I. Guardrails (all enforced on the server, not only in the browser): single-step cap; floor and ceiling at 80% to 120% of our market price; block when confidence is Low; block when SOURCES_DISAGREE until a person marks it reviewed; daily limit of 20 changes per owner; 5 minute delay before sending so a batch can be cancelled; every attempt written to an audit log.
J. Other endpoints: GET /portfolio (units with scores and PriceLabs numbers), GET /units/:id (comps, 12-month trend, PriceLabs history), POST /portfolio/import (CSV: unit, rent, optional building, beds, size_m2, lease_end; market numbers are computed, not required). Alerts: 90 days before a lease ends, notify the owner if the unit is not on target, with the suggested rent.
K. Security: login required, each owner sees and changes only their own units, roles (viewer, approver), data encrypted at rest, tests with fixed sample data including a fake PriceLabs server.

3. KARIM: DASHBOARD

A. Build the screens in the approved mockup: summary tiles, dot-and-diamond chart, "What to do next" table with tick boxes and totals, renewal calendar, unit detail with 12-month market line and "Try a new rent" slider, similar apartments list, CSV import.
B. Add PriceLabs to every view. Chart: add a hollow square for the PriceLabs recommendation next to the diamond for our market price. Table: add a PriceLabs column, show the percent difference, and shade rows with a SOURCES_DISAGREE warning. Unit detail: add the PriceLabs line to the 12-month chart.
C. Add the "Review and send to PriceLabs" panel (see the sample report page 4): current price in PriceLabs, proposed price with percent change, effective date, reason, guardrail checks with tick or cross, status line (Proposed, Awaiting approval, Sent, Confirmed or Failed). Button "Approve and send to PriceLabs" and "Cancel". Show server errors in plain words.
D. Bulk: ticked moves in the table open one review screen listing every change and the total effect per month and per year. Approve all or untick single ones.
E. History page: every change with who, when, old and new price, status, and an Undo button while undo is possible. Show "last updated" time and data source on every page.
F. Colours and wording: blue = you charge less than the market, grey = on target, red = you charge more. Every colour comes with a word and an arrow (colour-blind safe, no red and green pairs). Works at 400 px phone width with no sideways page scroll. Light and dark themes. Loading, empty and error states. Show a note that rent increases may be limited by law or by the lease.

DONE WHEN

Real units and real market data replace the sample data. Scores match a hand-checked sample of 20 units. MAPE is shown and under 10%, or we know why not. A test price change is approved on the dashboard, appears in PriceLabs, is read back as confirmed, and undo restores it. A change that breaks a guardrail is refused with a clear message. The page loads in under 2 seconds with 200 units. No API keys are in the repo.
