WYZRENT · RENT WATCH

My Apartments

Sample report. Are you charging too little or too much per night for each apartment, how does it compare with the market and with PriceLabs, and what should you change? All prices in AED per night.

Real apartments, sample prices. The six apartments (Palm Tower, Mada Residences, City Walk) come from the WYZ Rent brochure. The nightly rates, market prices and PriceLabs numbers are invented to show the layout. Sizes marked “not listed” were not in the brochure.

▼ Underpriced	Room to raise rates	▲ Vacancy risk	● On target	⚠ Sources disagree
3	**+AED 860**	**1**	**2**	**1**
of 6 apartments	a night, about +AED 235,425 a year if booked 75% of nights	priced above market	within 5% of market	check before changing

Average nightly rate today: **AED 1,208**. At our market price it would be **AED 1,333**.

Colour key

■ ▼ **Far below market**	More than 15% under
■ ▼ **Below market**	5% to 15% under
■ ● **On target**	Within 5%
■ ▲ **Above market**	5% to 15% over
■ ▲ **Far above market**	More than 15% over

Blue means you charge less than the market. Grey means on target. Red means you charge more. Every colour also has a word and an arrow, so the report reads correctly in black and white.

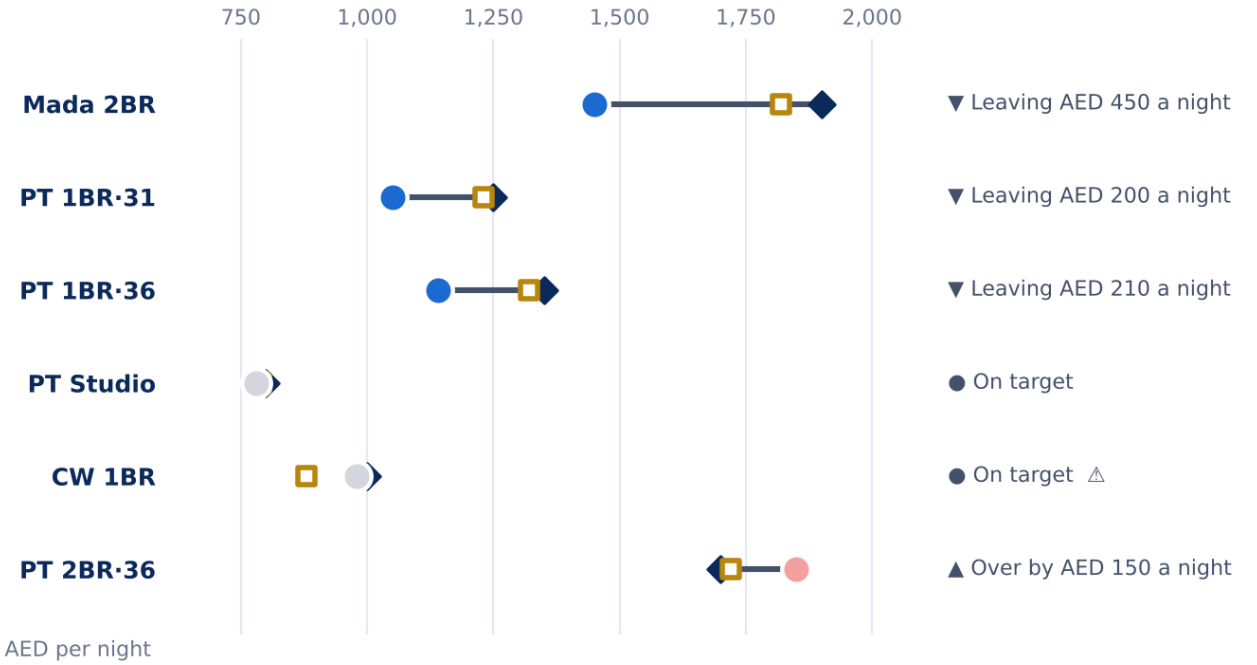

Three numbers are compared for every apartment

Rate now What you charge per night today.	**Our market price** What similar holiday homes nearby charge per night, from the scoring engine.	**PriceLabs recommendation** The nightly price PriceLabs suggests for the same apartment.

When our market price and PriceLabs are within 7% of each other, the dashboard suggests a new rate from their average. When they are further apart, it shows “Review: sources disagree” and sends nothing until a person has looked. Holiday-home prices move with the season, so the dashboard also shows demand through the year.

Your nightly rate against the market

Each row is one apartment. The coloured dot is what you charge per night now. The dark blue diamond is our market price. The hollow gold square is the PriceLabs recommendation. The line between dot and diamond is the nightly gap. ⚠ marks apartments where PriceLabs and our price disagree.

Sorted from most underpriced (top) to most overpriced (bottom). Dot colour = band, as in the key on page 1.

The apartments

Short name	Apartment	Size	Rate now	Our market	PriceLabs	Comparables
CW 1BR	City Walk Building 6A · 1 bed	1,200 sqft	AED 980	AED 1,000	AED 880	15 (Medium)
Mada 2BR	Mada Residences · 2 bed · 12th floor	1,600 sqft	AED 1,450	AED 1,900	AED 1,820	24 (High)
PT 1BR·31	Palm Tower · 1 bed · 31st floor	not listed	AED 1,050	AED 1,250	AED 1,230	18 (Medium)
PT 1BR·36	Palm Tower · 1 bed · 36th floor	1,200 sqft	AED 1,140	AED 1,350	AED 1,320	22 (High)
PT 2BR·36	Palm Tower · 2 bed · 36th floor	not listed	AED 1,850	AED 1,700	AED 1,720	10 (Low)
PT Studio	Palm Tower · Studio · 36th floor	850 sqft	AED 780	AED 800	AED 790	26 (High)

Apartment by apartment: comparison and suggested move

Suggested rate = 97% of the average of our market price and PriceLabs for underpriced apartments, or 103% for overpriced ones, only when the two sources agree within 7%. A single change is capped at 15%, so bigger gaps are closed in steps. Apartments with fewer than 12 comparables are blocked until reviewed.

Apartment	Rate now	Our market	PriceLabs	Where you are	Suggested move	Change / night
Mada 2BR Mada Residences	AED 1,450	AED 1,900	AED 1,820	▼ Far below market 24% under	▲ Raise to AED 1,660 then AED 1,800 at next review	**+AED 210**
PT 1BR·31 Palm Tower	AED 1,050	AED 1,250	AED 1,230	▼ Far below market 16% under	▲ Raise to AED 1,200	**+AED 150**
PT 1BR·36 Palm Tower	AED 1,140	AED 1,350	AED 1,320	▼ Far below market 16% under	▲ Raise to AED 1,290	**+AED 150**
PT Studio Palm Tower	AED 780	AED 800	AED 790	● On target	● Keep as is	—
CW 1BR City Walk	AED 980	AED 1,000	AED 880 −12% vs ours	● On target	⚠ Review: sources disagree	—
PT 2BR·36 Palm Tower	AED 1,850	AED 1,700	AED 1,720	▲ Above market 9% over	⚠ Blocked: only 10 comparables would lower to AED 1,760	—

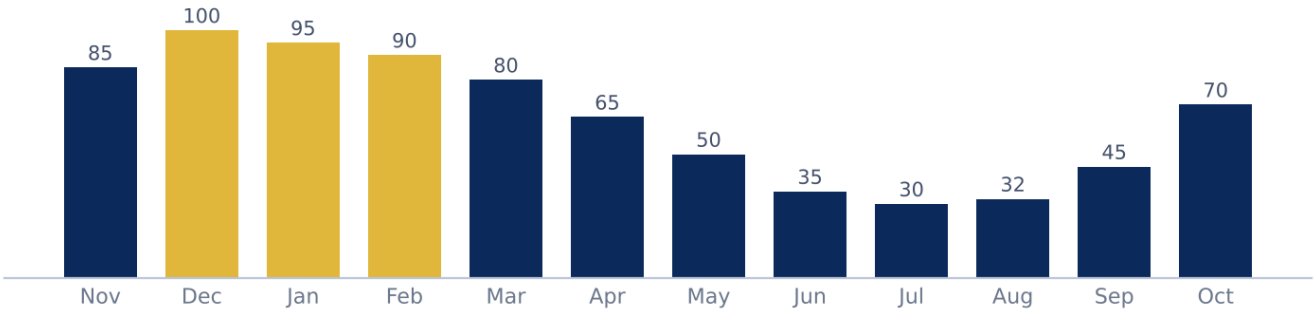

3 changes ready (shaded rows need a review first)

Effect: **+AED 510 a night · about +AED 139,612 a year** if booked 75% of nights

Changes apply to open dates from tomorrow. Bookings that already exist keep the price the guest booked.

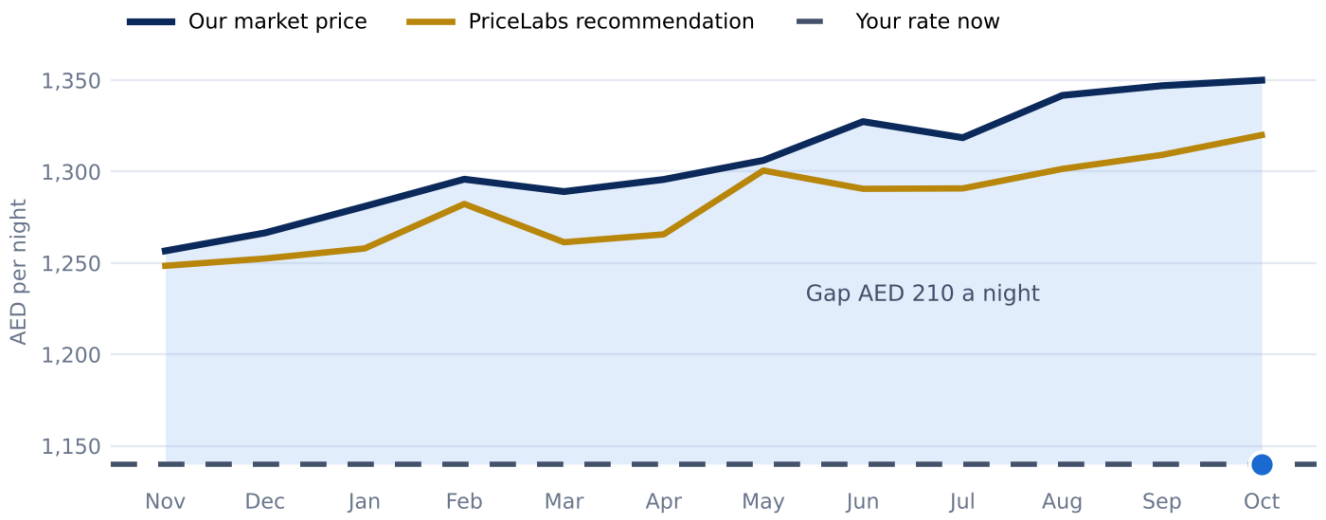

Demand through the year (sample pattern)

Gold bars are the peak months. In peak months the market can carry higher rates, in quiet months a lower rate fills the calendar. PriceLabs adjusts for this by date, and the dashboard shows where your base rates sit.

Apartment detail: Palm Tower · 1 bed · 36th floor

1 bed · 1,200 sqft. Rate now AED 1,140 a night. Our market price AED 1,350. PriceLabs recommends AED 1,320.

The shaded area is the money you are not collecting each night. Both the market and PriceLabs have risen over the year while your rate stayed flat.

Review and send the new price to PriceLabs (screen sample)

Apartment	Palm Tower · 1 bed · 36th floor
Current price in PriceLabs	AED 1,140 per night (read from PriceLabs 06:00 today)
Proposed new price	**AED 1,290** per night (+AED 150, +13%).
Applies to	Open dates from tomorrow. Existing bookings keep their price.
Why	16% below our market price and 14% below the PriceLabs recommendation. Both sources agree within 7%.
Guardrail checks	✔ Within 15% single-step cap ✔ Inside floor and ceiling (70%–130% of market) ✔ Above your PriceLabs minimum price ✔ Confidence is High (22 comparables) ✔ Sources agree ✔ Not over today's limit of 20 changes
Status	Proposed → **Awaiting your approval** → Sent → Confirmed

Approve and send to PriceLabs | **Cancel**

How the dashboard tells PriceLabs to change a price

The dashboard never changes a price silently. Every change goes through six steps, and nothing leaves our server until a person approves it.

Safety rules built into the push

- Approval required for every change. No automatic sending in version 1.
- Single-step cap: no change larger than 15% at once. Bigger gaps are closed in two or more steps.
- Floor and ceiling: the new price stays between 70% and 130% of our market price, and never below the minimum price set in PriceLabs.
- No change when confidence is Low (fewer than 12 comparables), or when our market price and PriceLabs differ by more than 7%, until a person reviews it.
- Changes apply to open dates from tomorrow. Existing bookings keep their price. No change to dates less than 2 days away without extra confirmation.
- Daily limit on the number of changes, and a short delay so a mistaken batch can be cancelled.
- Read-back check: after sending, the server reads the price from PriceLabs again and compares. A mismatch shows as Failed with the reason.
- Full history: who approved, old price, new price, time, and the PriceLabs response. One-click undo restores the previous price.

Where Hostaway fits in

Hostaway stays the source of truth for your apartments, calendar and bookings. The dashboard reads it with a read-only key to get the apartment list, nightly rates and reservations, which give occupancy and the average daily rate. PriceLabs is the pricing engine. Price changes from the dashboard go through PriceLabs, so PriceLabs and Hostaway never overwrite each other. Someone with admin rights creates the Hostaway API credentials in the Hostaway dashboard and adds them as secrets on the server. They are never pasted into chat or code.

What needs confirming first

Which Hostaway API credentials and permissions your account allows. Which price changes your PriceLabs plan lets us make through its API (for example base price, minimum and maximum price, or date-specific overrides), and the rate limits for both. If writing to PriceLabs is not allowed, the fallback is an export of approved prices that you upload by hand, with the same approval and history.

Implementation prompt for Abbas and Karim

Copy everything on this page and the next into a message. Fill in the three blanks in square brackets first. Karim builds the dashboard, Abbas builds the data, scoring, Hostaway and PriceLabs connections. Swap the names if needed.

PROJECT

Rent Watch for WyzRent holiday homes in Dubai. A dashboard for the owner. For each apartment it shows the nightly rate we charge today, compares it with (1) the short-term rental market and (2) PriceLabs, says whether we are below, on or above the market, suggests a new nightly rate, and lets the owner approve the change and send it to PriceLabs from the dashboard. All prices are in AED per night. Approved mockup and sample report: [links].

WHO DOES WHAT

Karim: dashboard (front end). Abbas: data, scoring, and the Hostaway and PriceLabs connections (back end). Agree the data shapes in section 1 on day one so you can work in parallel.

BLANKS TO FILL BEFORE SENDING

Who creates the Hostaway and PriceLabs API credentials: [name]. Occupancy assumption for yearly estimates: [75%]. Alerts by: [email or WhatsApp].

1. DATA SHAPES

Apartment: { id, building, name, beds, size_sqft (may be unknown), floor, view, hostaway_listing_id, pricelabs_listing_id, nightly_rate_now (AED), min_price, max_price, status }
Booking (from Hostaway): { reservation_id, apartment_id, check_in, check_out, nightly_rate, channel, status }
MarketScore: { fair_nightly, fair_low, fair_high, deviation_pct, band, confidence, comps_count, reasons: [text], trend_12m: [12 monthly fair prices], occupancy_30d, adr_30d }
PriceLabsSnapshot: { apartment_id, taken_at, base_price, min_price, max_price, recommended_price, overrides: [{date, price}] }
PriceChange: { id, apartment_id, old_price, new_price, scope: base_price | date_override, date_range, reason, source_prices: {market, pricelabs}, status: proposed | approved | sent | confirmed | failed | cancelled | undone, proposed_by, approved_by, approved_at, pricelabs_response, readback_price, created_at }
deviation_pct = (nightly_rate_now - fair_nightly) / fair_nightly. Bands: far below <= -15%, below -15% to -5%, on target within 5%, above 5% to 15%, far above > 15%.

2. ABBAS: DATA, SCORING, HOSTAWAY, PRICELABS

A. Hostaway (read-only first). Hostaway is the source of truth for apartments, calendar and bookings. Hostaway API credentials (typically a client ID and secret created by an admin in the Hostaway dashboard, exchanged for an access token) go only in the environment variables HOSTAWAY_CLIENT_ID and HOSTAWAY_CLIENT_SECRET, never in code, the browser, logs or chat. Confirm the exact steps, endpoints and limits in Hostaway's API documentation. Pull listings, calendar rates and availability, and reservations. From reservations compute occupancy and average daily rate for the last 30 and 90 days.
B. PriceLabs. Confirm first, in PriceLabs documentation or with their support, in one page: which read endpoints give us listings, base, minimum and maximum price, recommended price and overrides; which write operations our plan allows (base price, min and max, date-specific overrides); rate limits. The key goes only in PRICELABS_API_KEY. If writing is not allowed, build the fallback: an export file of approved prices for manual upload, with the same approval and history. Price changes always go through PriceLabs, never straight into the Hostaway calendar, so the two systems do not overwrite each other.
C. Market data. PriceLabs market data if the API provides it, otherwise a licensed short-term-rental data provider or partner feed. Do not scrape any site whose terms forbid it. Most listing platforms forbid scraping, so check each site's terms and prefer licensed data. Respect rate limits.
D. Fair nightly rate per apartment. Compare like with like: same area or building, same bedrooms, similar size, view and amenities, and the same dates (same weekdays and season). Median of comparable listings with at least 8 comps, then a regression on log(nightly rate) with bedrooms, size, floor, view, building, season, weekday or weekend, and lead time. Fall back to comps when data is thin. Measure error on held-out data (MAPE), show it in the dashboard, target under 12%. Confidence: High 20 or more comps, Medium 12 to 19, Low below 12.
E. Compare with PriceLabs. For each apartment return rate now, our market price, the PriceLabs recommendation and the percent difference between the last two. If they differ by more than 7%, set SOURCES_DISAGREE and make no automatic suggestion. Use occupancy as a second signal: a rate below market with occupancy above 90% means raise with confidence. A rate above market with occupancy below 50% means lower.

F. Suggested price. On target: keep. Below market: 97% of the average of our market price and the PriceLabs recommendation. Above market: 103% of that average. Cap any single change at 15%. When the gap is bigger, propose the capped step now and the next step at the next review. Keep the result inside 70% to 130% of our market price and inside the PriceLabs minimum and maximum.
G. Price change workflow (server side). POST /price-changes creates a proposal. POST /price-changes/:id/approve records the approver. A background worker (1) re-runs all guardrails, (2) calls PriceLabs to set the price for open dates from tomorrow, (3) reads the price back, (4) sets the status to confirmed or failed with the reason. Existing bookings keep their price. Use idempotency keys so a retry never sends twice. POST /price-changes/:id/undo restores the old price. GET /price-changes lists history.
H. Guardrails, all enforced on the server: single-step cap; floor and ceiling; block when confidence is Low; block when SOURCES_DISAGREE until a person marks it reviewed; no change to dates less than 2 days away without extra confirmation; daily limit of 20 changes per owner; 5 minute delay before sending so a batch can be cancelled; every attempt in an audit log.
I. Endpoints: GET /portfolio (apartments with scores, occupancy and PriceLabs numbers), GET /apartments/:id (comps, 12-month trend, bookings), GET /season (monthly demand index), plus the price-change endpoints above. Alerts to [email or WhatsApp]: rate far below market with occupancy above 90%; rate above market with occupancy below 50% for the next 30 days.
J. Security: login required, roles (viewer, approver), data encrypted at rest, secrets only in the server environment, tests with fixed sample data including fake Hostaway and PriceLabs servers.

3. KARIM: DASHBOARD

A. Build the screens in the approved mockup: summary tiles, three-price chart (dot = rate now, diamond = our market price, hollow square = PriceLabs), "What to do next" table with tick boxes and totals, change history with undo, demand through the year, apartment detail with the 12-month line and "Try a new rate" slider, and CSV import.
B. Show every price as AED per night (example: AED 1,150). Sizes in sqft, and show "not listed" when unknown. Studio shows as Studio.
C. The "Review and send to PriceLabs" panel (see page 4 of the sample report): current price in PriceLabs, proposed price with percent change, what dates it applies to, reason, guardrail checks with tick or cross, status line (Proposed, Awaiting approval, Sent, Confirmed or Failed), buttons "Approve and send to PriceLabs" and "Cancel" with a second confirmation. Show server errors in plain words.
D. Bulk: ticked changes open one review screen with each change, whether it passes the guardrails, and the total effect per night and per year. Failing changes are skipped, not sent.
E. History page: who, when, old and new price, status, and an Undo button while undo is possible. Show "last updated" time and the data source (Hostaway, PriceLabs, market data) on every page.
F. Colours and wording: dark blue and gold on white. Blue = we charge less than the market, grey = on target, red = we charge more, in every chart. Every colour comes with a word and an arrow (colour-blind safe, no red and green pairs). Works at 400 px phone width with no sideways page scroll. Loading, empty and error states.

DONE WHEN

Real apartments, bookings and market data replace the sample data. Scores match a hand-checked sample of all apartments. MAPE is shown and under 12%, or we know why not. A test price change is approved on the dashboard, appears in PriceLabs, is read back as confirmed, and undo restores it. A change that breaks a guardrail is refused with a clear message. The page loads in under 2 seconds. No credentials are in the repo.
